Attorney's Dock

## CLAIMS

- 1 1. A method comprising:
- selecting one of a plurality of debugging modes as a
- function of a current operating mode of a processor.
- 1 2. The method of claim 1 further comprising raising an
- 2 exception after executing an instruction.
- 1 3. The method of claim 1 further comprising invoking an
- 2 emulation mode of the processor after executing an
- 3 instruction.
- 1 4. The method of claim 1 wherein selecting the debugging
- 2 mode comprises selecting a first debugging mode when the
- 3 operating mode comprises user mode, and selecting a second
- 4 debugging mode when the operating mode comprises supervisor
- 5 mode.
- 1 5. A method comprising:
- 2 receiving an instruction;
- 3 receiving a signal;
- selecting a mode of debugging as a function of the
- signal, wherein selecting the debugging mode comprises

- 6 selecting a first debugging mode when the signal is a first
- signal, and selecting a second debugging mode when the
- 8 signal is a second signal; and
- executing the instruction.
- 1 6. The method of claim 5 further comprising raising an
- 2 exception.
- 1 7. The method of claim 5 further comprising invoking an
- 2 emulation event.
- 1 8. The method of claim 5 further comprising:
- sensing register contents; and
- outputting register contents.
- 1 9. The method of claim 5, wherein the instruction is
- 2 received by a processor adapted to operate in a plurality
- of states, the method further comprising:
- sensing states of the processor; and
- outputting states of the processor.
- 1 10. The method of claim 5, wherein the instruction is
- 2 received by a processor, the method further comprising

- selecting a mode of single-step debugging as a function of 3
- the operating mode of the processor.
- 11. A device comprising: 1
- a processor, the processor adapted to operate in a 2
- plurality of operating modes including an emulation mode; 3
- a control register adapted to store the state of a 4
- control bit; and 5
- 6 an exception handler;
- wherein the processor is adapted to select one of a 7
- plurality of debugging modes as a function of the control 8
- 9 bit.
- The device of claim 11, wherein the processor is 1
- adapted to select one of a plurality of debugging modes as 2
- a function of the current operating mode of the processor.
- The device of claim 11, further comprising exception 1
- logic adapted to sense the state of the control bit and to 2
- trigger an exception event as a function of the state of 3
- the control bit.
- The device of claim 11, further comprising emulation 1
- logic adapted to sense the state of the control bit and to 2

- 3 trigger an emulation event as a function of the state of
- 4 the control bit.
- 1 15. The device of claim 11, wherein the control bit is a
- 2 first control bit, the system further comprising a second
- 3 control bit, and wherein the mode of single-step debugging
- 4 is a function of the state of the second control bit.
- 1 16. The device of claim 11, wherein the processor is a
- 2 digital signal processor.
- 1 17. A device comprising:
- a processor, the processor adapted to operate in a
- 3 plurality of operating modes;
- wherein the processor is adapted to select one of a
- 5 plurality of debugging modes as a function of the current
- operating mode of the processor.
- 1 18. The device of claim 17 further comprising a control
- 2 register adapted to store the state of a control bit,
- 3 wherein the processor is adapted to select one of the
- 4 plurality of debugging modes as a function of the state of
- 5 the control bit.

- The device of claim 18, further comprising: 19. 1
- an exception handler; and 2
- logic adapted to sense the state of the control bit 3
- and to trigger an exception event as a function of the 4
- state of the control bit.
- The device of claim 18, further comprising logic 20. 1
- adapted to sense the state of the control bit and to 2
- trigger an emulation event as a function of the state of 3
- the control bit.

HETSHEW TES

4

- The device of claim 17, wherein the processor is a
- digital signal processor.
- 22. A system comprising: 1
- a processor, the processor adapted to operate in a 2
- plurality of operating modes; 3
- a control register adapted to store the state of a 4
- control bit;
- an input/output device; and 6
- an exception handler; 7
- wherein the processor is to adapted to select one of a 8
- plurality of debugging modes as a function of the control
- bit. 10

- The system of claim 22, wherein the processor is
- adapted to select one of a plurality of debugging modes 2
- based upon the current operating mode. 3
- The system of claim 22, further comprising a memory 1
- device coupled to the processor. 2
- 25. The system of claim 22, further comprising logic 1
- adapted to sense the state of the control bit and to
- trigger an exception event as a function of the state of 3
- the control bit.
- The system of claim 22, further comprising logic 1
- adapted to sense the state of the control bit and to 2
- trigger an emulation event as a function of the state of
- the control bit. 4
- 27. The system of claim 22, wherein the control bit is a
- first control bit, the system further comprising a second 2
- control bit, wherein the processor is adapted to select one 3
- of a plurality of debugging modes based upon the state of
- the second control bit. 5
